

Denza™ FAQs

How long is an average treatment?

An average full face and eye treatment is approximately 45 minutes. Treatment times may vary if you're targeting specific areas of the face or body.

What should I do to prepare for the treatment?

Before your Denza™ treatment, it is advisable to arrive hydrated and ensure your skin is clean and free from any lotions, creams, or makeup in the treatment area.

What does the treatment feel like?

Denza™ features an advanced cryogen cooling that will keep you comfortable during the procedure. However, prior to the start of your treatment, your provider may recommend the use of a topical anesthetic that will further ensure a very comfortable experience.

What should I do to maximize my results after the treatment?

You should drink plenty of water to enhance the results and aid your body's natural healing process. Normal skincare may be resumed 24 hours post Denza™ treatment.

What downtime should I expect from the treatment?

Denza™ treatments typically have minimal to no downtime, with many patients returning to their regular activities shortly after the procedure. However, this may vary depending on the individual and the treatment area.

What areas can be treated with Denza™?

Denza™ is versatile and can be used to treat a wide range of areas, including the face, eyes, and body. However, radiofrequency is not to be used over any metal implants, screws, artificial joints, people with heart valves, pacemakers, or copper intrauterine devices (for abdominal treatments).

Denza™ Treatment

Denza™ sets a new standard by combining both monopolar + bipolar radiofrequency, along with cryogen cooling. This unique fusion not only ensures the efficacy and comfort of the treatment, but also sets the stage for instant and enduring results that patients can trust.

With a commitment to delivering both immediate and lasting outcomes, Denza™ is ideal for patients like you that are seeking to achieve remarkable skin tightening* and an age-defying appearance.

What Denza™ Treats

Denza™ is a revolutionary aesthetic device that offers a comprehensive solution for a range of skin concerns and all skin types. Denza's pulsing technology stimulates collagen proliferation, resulting in exceptional skin tightening*, making it ideal for addressing issues on the face, eyes, and body.

The Denza™ treatment uses radiofrequency technology to heat the deeper, collagen-rich layers of the skin.

The applied heat causes collagen to contract and encourages new collagen to develop.

While most patients achieve their desired results with just a one treatment protocol, your provider will discuss your goals during the consultation and create a treatment plan that is right for you.

How Denza™ Works

Denza™ leverages cutting-edge technology to achieve outstanding results. The three-stage, seven-step adjustable cooling system ensures maximum patient comfort and safety.

Real-time impedance calibration, powered by high-speed impedance feedback technology, guarantees uniform energy delivery, while unique and advanced handpiece features enable precise monitoring and reduced treatment times.

Benefits of Denza™

There are many benefits to the Denza treatment, including:

- Immediate and visible results
- Effects are long-lasting, with continuous enhancement over four to six months
- Can be used on most areas of the body
- Safe and effective
- Comfortable and suitable for all skin types

Ask your provider if Denza™ is right for you!
